

Evaluating a PROJECT

The process of evaluating a project is more complex than it sounds. But, what is a project evaluation? There are stages to evaluate a project, it requires a pre-evaluation that checks if the aim is possible, useful, and reliable. All of this before the project begins. What's next is about managing budgets, allocating resources, monitoring performance, organizing a timeline, etcetera. Last but not least, after the project is done, you have to look back to measure the overall results and how the work was done. It is important to ask yourself; Does the project solve the intended problem? Did it reach the proposed goals? Did the resources were efficiently used without excessive wasting? And what changes are being noticed after the project is finished?.

This is crucial to prevent useless wasting, to prove value to stakeholders and teaches lessons for future initiatives in other projects. If everything turns out well done, it means that some aspects were analyzed to improve on the working, for example; results and performance, operations and resources, strategy and design, and people and governance. To evaluate the final work you can use tools such as KPIs (Key Performance Indicator), Timelines, Milestones. Looking back to see the good things and the mistakes committed is a great way of learning.

SELF-ASSESSMENT

Self-assessment is the process where an individual or organization reviews their own performance, skills, and behavior against set standards. It is also very important for the pre-project, during the project and afterwards. Evaluating work performance, technical abilities, and productivity, checking your own understanding of topics and study methods, and following the way you reached your goals. Now peer assessment is the same, but done to your project partner, like collaborative feedback, where both of you help each other to improve. It matters because it improves communication, saves time and builds teamwork. It is really effective.

RUBRIC

A rubric is a scoring guide used to evaluate performance, products, or projects based on a specific set of criteria. The rubric structure is organized on 1.Criteria is the specific factors being assessed (e.g., Content Accuracy, Organization, Design).

2. Rating Scale: The levels of achievement, often numerical or descriptive (e.g., 1 to 4, or Needs Improvement, Proficient, Exemplary), and 3. Descriptors: Explicit sentences explaining what success looks like for every single criterion at every scale level. The rubric is fundamental as it acts as a blueprint for grading by defining exactly what work looks like at various levels of quality.

What makes a Project SUCCESSFUL?

A project is successful when it delivers its intended value to stakeholders while balancing constraints like scope, time, quality, and budget. Success is no longer measured just by finishing on time, but by whether the project actually solves the problem it was created to fix.
